

# Table of content QFT

(27 lectures - 27 slots)

1. <u>Canonical quantisation of scalar fields</u>	1
1.1. Classical field theory in Lagrange and Hamilton formalism Noether's theorem	5
1.2. Foundation of quantisation: Hamilton formalism	7
1.3. Canonical quantisation of a free scalar field	11
1.4. Propagators - 2 point functions	16
1.5. Interacting scalar fields, S-matrix	20
1.6. Green functions	24
1.7. Perturbation theory	28
2. <u>Path integral quantisation of scalar fields</u>	32
2.1. Path integral in Quantum Mechanics	
2.2. Wick's Theorem and the Schwinger propagator in the path integral formalism	35
2.3. Schwinger - Dyson equations and generating functionals	42
3. <u>Renormalisation</u>	48
3.1. Power counting and regularisation	
3.2. Bare and renormalised Green functions	55
3.3. Renormalisation group	59
4. <u>Fermions</u>	64
4.1. Quantisation of the Dirac field	
4.2. Fermionic path integrals	69
4.3. Euclidean Dirac fields	73
5. <u>Gauge fields</u>	77
5.1. Building an invariant action for local groups: $U(1)$	78
5.2. Quantisation of gauge fields: $U(1)$	81
5.3. Faddeev - Popov method and ghosts	86
5.4. Ward - Takahashi identity and self-energy in QED	91
5.5. One-loop renormalisation of QED	96
5.6. Effective action and background field method	102
5.7. The QCD beta-function and asymptotic freedom	107
6. <u>Symmetries in QFT</u>	111
6.1. Classical vs. quantum field theory	116
6.2. BRST-symmetry	120
7. <u>The large-<math>N_c</math> limit</u>	
8. <u>Spontaneous symmetry breaking</u>	125
