Aktuelle Veranstaltungen

Kolloquium

Thema: tba

Datum: 14.10.19

Uhrzeit: 16:15

Ort: H6

Vortragender: Prof. Dr. Christine Silberhorn

Universität Paderborn

Inhalt:

Ansprechpartner: W. Pfeiffer

Kolloquium Mathematische Physik

Thema: Counting bound states: From Weyl to Maximal Fourier Multipliers

Datum: 05.07.19

Uhrzeit: 16:15

Ort: V2-200

Vortragender: Dirk Hundertmark

KIT
Deriving precise estimates for bound states has a long history. It ranges from Rayleigh's theory of sound and Weyl's asymptotic to more detailed questions concerning the eigenvalue distribution of Schrödinger operators. We will give a personally biased sketch of some of the history and discuss some new results, including the somewhat surprising fact how tools from harmonic analysis - so-called maximal Fourier multiplier bounds - can help in counting bound states.

Seminar Hochenergiephysik

Thema: tba

Datum: 20.09.19

Uhrzeit: 14:15

Ort: D6-135

Vortragender: Prabharkar Tiwari

NAOC Beijing

Ansprechpartner: D. Schwarz

Seminar Kondensierte Materie

Next-neighbor particle-particle interaction of fermions in quasi-one-dimensional flat-band lattices

Thema: Next-neighbor particle-particle interaction of fermions in quasi-one-dimensional flat-band lattices

Datum: 22.07.19

Uhrzeit: 14:15

Ort: D5-153
**Vortragender:** Simon Tilleke

Bielefeld University

**Inhalt:**

**Thema:**

Critical behaviour and characteristic polynomials of non-Hermitian random matrices

**Datum:** 23.05.19

**Uhrzeit:** 16:15

**Ort:** D5-153

**Vortragender:** Nicholas Simm

University of Sussex

I will discuss some recent developments regarding the normal matrix model. In particular my interest will be in certain critical models where the limiting support of the eigenvalues can radically change its topology by slightly adjusting an external parameter. I will discuss how aspects of the model can be explicitly mapped to the study of expectations of characteristic polynomials of non-Hermitian random matrices (e.g. Ginibre or truncated unitary). Many of these averages are related to Painlevé transcendents, and by exploiting this, a precise and non-trivial asymptotic expansion of partition functions can be calculated in the critical models. This is joint work with Alfredo Deaño (University of Kent).

**Thema:**

Eigenvalue Spacings of Random Matrices compared to Locations of Buzzard Nests
The territorial behavior of buzzards suggests a repulsion between the nests that may match with the repulsion between complex eigenvalues of non-hermitian random matrices. The Ginibre ensemble and the nearest neighbor spacings of the two-dimensional eigenvalues will be introduced and compared to the Poissonian Process in the plane. Then we will calculate the spacings between buzzard nests and the Kolmogorov distance to both theoretical curves. For this aim, the unfolding of the data set is indispensable, so that areas of high human settlement do not influence the spacing statistics. Two different unfolding methods in 2D will be tested and applied.
